Introduction

This document describes the command line tools of the **Nessus** vulnerability scanner. Please email any comments and suggestions to support@tenable.com.

Tenable Network Security, Inc. is the author and maintainer of the Nessus vulnerability scanner. In addition to constantly improving the Nessus engine, Tenable writes most of the plugins available to the scanner, as well as compliance checks and a wide variety of audit policies.

Prerequisites, deployment options, and a walk-through of an installation are described in this document. A basic understanding of Unix and vulnerability scanning is assumed.

Nessus Manager and Professional

Many of the administrative tools are available via command line. This allows the user to manage user accounts, modify advanced settings, manage digital certificates, report bugs, update Nessus, and fetch necessary license information. This command is called `nessuscli` and is available on all Nessus 6.x supported platforms.

Note that the majority of the examples show usage for Nessus Manager and Nessus Professional. The examples for Nessus Agents are specified in the [Nessus Agents](#) section.

Overview and Basic Usage

The following table provides instructions for running the Nessus command line tool **nessuscli** on all supported platforms. The basic usage for all operating systems are listed below:

Operating System	Command
Linux	# /opt/nessus/sbin/nessuscli <cmd> <arg1> <arg2>
FreeBSD	# /usr/local/nessus/sbin/nessuscli <cmd> <arg1> <arg2>
Mac OS X	# /Library/Nessus/run/sbin/nessuscli <cmd> <arg1> <arg2>
Windows 32-bit	c:\> \Program Files (x86)s\Tenable\Nessus\nessuscli.exe <cmd> <arg1> <arg2>
Windows 64-bit	c:\> \Program Files\Tenable\Nessus\nessuscli.exe <cmd> <arg1> <arg2>

Note: All following examples will be in the standard Linux format. Please adjust for your operating system accordingly.

Help Commands

To display the command line usage for **nessuscli**, type the following:

Windows 32-bit:

```
C:\Program Files (x86)\Tenable\Nessus>nessuscli help
```

Windows 64-bit:

```
C:\Program Files\Tenable\Nessus>nessuscli help
```

Mac OS X:

```
# /Library/Nessus/run/sbin/nessuscli help
```

Unix (modify path for your installation):

```
# /opt/nessus/sbin/nessuscli help
```

This will return the help output. The help output may vary, depending on the Nessus license. For example, the output for Nessus Manager will display as follows:

```
Usage: nessuscli command [options]
Usage: nessuscli command help

Bug Reporting Commands:
- bug-report-generator
- bug-report-generator --quiet [--full] [--scrub]

User Commands:
- rmuser [username]
- chpasswd [username]
- adduser [username]
- lsuser

Manager Commands:
- manager download-core
- manager generate-plugins

Fetch Commands:
- fetch --register <serial>
- fetch --register-offline [<file.rc>]
```

- fetch --check
- fetch --code-in-use
- fetch --challenge
- fetch --security-center

Fix Commands:

- fix [--secure] --list
- fix [--secure] --set <name=value>
- fix [--secure] --get <name>
- fix [--secure] --delete <name>
- fix --list-interfaces
- fix --reset

Certificate Commands:

- mkcert-client
- mkcert [-q]

Software Update Commands:

- update
- update --all
- update --plugins-only
- update <plugin archive>

If you want to see help for a specific command, the syntax is:

```
# nessuscli <cmd> help
```

An example of this help usage is:

```
# /opt/nessus/sbin/nessuscli bug-report-generator help
```

Usage: nessuscli bug-report-generator

Usage: nessuscli bug-report-generator --quiet [--full] [--scrub]

Generate an archive of system diagnostics.

Running without arguments will prompt for values.

--quiet: run the bug report generator without prompting user for feedback

--scrub: when in quiet mode, bug report generator will sanitize the last two octets of the IPv4 address

--full: when in quiet mode, bug report generator will collect extra data

Fix Commands

The `nessuscli fix` allows you to change the Nessus server settings from the command line. This includes managing advanced settings, resetting registration information, and listing network interfaces on the system.

Reset Registration and Erase Settings

To reset the registration information, shut down the `nessusd` service first. Next, run the `nessuscli fix --reset` command. You will be prompted for confirmation.

If you have not shut down the `nessusd` service, the `nessuscli fix --reset` command will exit.

```
# /sbin/service nessusd stop
# /opt/nessus/sbin/nessuscli fix --reset
Resetting Nessus configuration will permanently erase all your settings and cause
Nessus to become unregistered.
Do you want to proceed? (y/n) [n]: y
Successfully reset Nessus configuration.
```

View the Current Network Interfaces

To view the network interfaces, run the `nessuscli fix --list-interfaces` command. This will include all IPv4 and IPv6 interfaces.

```
# /opt/nessus/sbin/nessuscli fix --list-interfaces
Adapter# 0
  Name..... lo
  Real name ..... lo
  IP address ..... 127.0.0.1
  Network ..... 127.0.0.0
  Netmask ..... 255.0.0.0
Adapter# 1
  Name..... eth1
  Real name ..... eth1
  IP address ..... 172.26.42.243
  Network ..... 172.26.42.0
  Netmask ..... 255.255.252.0
Adapter# 0
  Name..... lo
  Real name ..... lo
  IPv6 address ... ::1
  IPv6 network ... ::1
  IPv6 netmask ... ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff
Adapter# 1
  Name..... eth1
  Real name ..... eth1
  IPv6 address ... fe80::250:56ff:fe10:76d
  IPv6 network ... fe80::
  IPv6 netmask ... ffff:ffff:ffff:ffff::
```

Manage Advanced Settings

The `nessuscli fix` command has a series of options to manage the advanced settings on your Nessus scanner. `nessuscli fix` also has a secure option for managing the advanced settings, which will act on the encrypted preferences. These preferences contain information about registration.

For the following commands, you can use the `--secure` flag:

```
# /opt/nessus/sbin/nessuscli fix --secure --list
# /opt/nessus/sbin/nessuscli fix --secure --fix --set <setting name=value>
# /opt/nessus/sbin/nessuscli fix --secure --get <setting>
# /opt/nessus/sbin/nessuscli fix --secure --delete <setting>
```

To view the currently set advanced settings:

```
# /opt/nessus/sbin/nessuscli fix --list
qdb_mem_usage: low
report_crashes: yes
stop_scan_on_hang: no
stop_scan_on_disconnect: no
reduce_connections_on_congestion: no
global.max_web_users: 1024
global.max_scans: 0
nasl_log_type: normal
nasl_no_signature_check: no
disable_xmlrpc: no
disable_ntp: yes
ssl_cipher_list: strong
xmlrpc_idle_session_timeout: 30
xmlrpc_listen_port: 8834
listen_port: 1241
listen_address: 0.0.0.0
slice_network_addresses: no
plugin_upload: yes
silent_dependencies: yes
auto_enable_dependencies: yes
safe_checks: yes
plugins_timeout: 320
non_simult_ports: 139, 445, 3389
```

```
checks_read_timeout: 5
allow_post_scan_editing: yes
optimize_test: yes
port_range: default
cgi_path: /cgi-bin:/scripts
rules: /Library/Nessus/run/etc/nessus/nessusd.rules
dumpfile: /Library/Nessus/run/var/nessus/logs/nessusd.dump
log_whole_attack: no
www_logfile: /Library/Nessus/run/var/nessus/logs/www_server.log
logfile: /Library/Nessus/run/var/nessus/logs/nessusd.messages
throttle_scan: yes
max_checks: 5
global.max_hosts: 2180
max_hosts: 100
purge_plugin_db: no
auto_update_delay: 24
auto_update: yes
```

To get a specific value from the set advanced settings:

```
# /opt/nessus/sbin/nessuscli fix --get <setting>
```

Example:

```
# /opt/nessus/sbin/nessuscli fix --get max_hosts
The current value for 'max_hosts' is '100'.
```

To delete a specific value from the set advanced settings:

```
# /opt/nessus/sbin/nessuscli fix --delete <setting>
```

Example:

```
# /opt/nessus/sbin/nessuscli fix --delete max_hosts
Successfully deleted 'max_hosts'.
```

To set a specific value from the set advanced settings:

```
# /opt/nessus/sbin/nessuscli fix --set <setting=value>
```

Example:

```
# /opt/nessus/sbin/nessuscli fix --set max_hosts=200  
Successfully set 'max_hosts' to '200'.
```

Configure Proxy Settings

Nessus can be configured to use a proxy for plugin updates, as many companies maintain a proxy for security and logging. The four proxy related settings can be manipulated via the `nessuscli` tool.

Example:

```
# nessuscli fix --secure --set proxy=[ip/hostname]
# nessuscli fix --secure --set proxy_port=[port]
# nessuscli fix --secure --set proxy_username=[user]
# nessuscli fix --secure --set proxy_password=[password]
```

Certificate Commands

The `nessuscli mkcert` commands offer the ability to create Nessus-supported self-signed digital certificates from the command line.

Create a Nessus Server Digital Certificate

To create a Nessus server digital certificate, run the commands and follow the prompts. Note that the defaults are in brackets.

```
# /opt/nessus/sbin/nessuscli mkcert
```

```
-----  
Creation of the Nessus SSL Certificate  
-----
```

This script will now ask you for information to create the SSL certificate for Nessus. Note that this information will **NOT** be sent to anybody (everything stays local), but anyone with the ability to connect to your Nessus daemon will be able to retrieve this information.

```
CA certificate life time in days [1460]: 1460  
Server certificate life time in days [365]: 365  
Your two letter country code [US]: US  
Your state or province name [NY]: MD  
Your city [New York]: Columbia  
Your organization [Nessus Users United]: Tenable Network Security  
This host name [localhost]: nessus-server
```

```
--- Confirmation ---
```

```
CA certificate life time in days: 1460  
Server certificate life time in days: 365  
Country: US  
State or province: MD  
City: Columbia  
Organization: Tenable Network Security  
This host name: nessus-server  
Is this ok? (y/n) [n]: y
```

Congratulations. Your server certificate was properly created.

```
The following files were created :  
Certification authority :  
Certificate = /opt/nessus/com/nessus/CA/cacert.pem  
Private key = /opt/nessus/var/nessus/CA/cakey.pem  
Nessus Server :
```

```
Certificate = /opt/nessus/com/nessus/CA/servercert.pem  
Private key = /opt/nessus/var/nessus/CA/serverkey.pem
```

For more details on configuring Nessus with custom SSL certificates, see [the latest Nessus user guide](#).

Create a Nessus Client-Side Digital Certificate

To create a Nessus client digital certificate, run the commands and follow the prompts. Note that the defaults are in brackets.

```
# /opt/nessus/sbin/nessuscli nessuscli mkcert-client

-----
Creation of the Nessus SSL Client Certificates
-----

This script will now ask you for information to create SSL client certificates.

Nessus username for user: admin
admin already exists. Do you want to overwrite their credentials? (y/n) [n]: y
Client certificate life time in days [365]:
Two letter country code [US]: US
State or province name [NY]: MD
City [New York]: Columbia
Organization [Nessus Users United]: Tenable Network Security
Organizational unit [nessus-users]: nessus-admins
Email [none@none.com]: nessus-admin@example.org

--- Confirmation ---
Username: admin
Client certificate life time in days: 365
Country: US
State or province: MD
City: Columbia
Organization: Tenable Network Security
Organizational unit: nessus-admins
Email: nessus-admin@example.org
Is this ok? (y/n) [n]: y

Congratulations. Your client certificate was properly created.

The following files were created :
Nessus Client :
Certificate = /Library/Nessus/run/var/nessus/tmp/cert_admin.pem
Private key = /Library/Nessus/run/var/nessus/tmp/key_admin.pem
```

The certificate was successfully set for admin.

Create another cert? (y/n) [y]: n

Note: If the user already has credentials, such as a password, this script will overwrite any previous credentials. Also, updating the password of the account will remove the client certificate for authentication.

User Management Commands

The `nessuscli` commands offer the ability to manage Nessus users from the command line. This includes listing the users, changing a user's password, adding a user, and removing a user.

List Users

To list Nessus users, run the following command:

```
# /opt/nessus/sbin/nessuscli lsuser  
admin  
auditor  
windowsadmin  
linuxadmin
```

Change a User's Password

Linux

To change a Nessus user's password in Linux, run the following command:

```
# /opt/nessus/sbin/nessuscli chpasswd username
```

Where **username** is the username for which you want to change the password.

In the `Login to change` field, enter the username, and then enter the new password twice as prompted. The password will not appear on the screen as you type.

Example: Change password for user `auditor` on Linux

```
# /opt/nessus/sbin/nessuscli chpasswd auditor
Login to change: auditor
New password:
New password (again):
Password changed for auditor
```

Windows

To change a Nessus user's password in Linux, log in to Windows with an account that has administrative privileges and run the following command:

```
cd c:\Program Files\Tenable\Nessus\nessuscli.exe chpasswd username
```

Where **username** is the username for which you want to change the password.

In the `Login to change` field, enter the username, and then enter the new password twice as prompted. The password will not appear on the screen as you type.

Example: Change password for user `auditor` on Windows

```
cd c:\Program Files\Tenable\Nessus\nessuscli.exe chpasswd auditor
New password:
New password (again):
Password changed for auditor
```

Add a User

When you add a user, you will be prompted for the username, password, administrative rights, and rules. Nessus rules limit a user's scanning range. To add a new Nessus user, run the `nessuscli adduser` command.

When running `nessuscli adduser` on Nessus Manager, you will be prompted for the user to have “system administrator” privileges. With Nessus Professional, you will be prompted for the user to have “administrator” privileges.

In Nessus Manager, if you wish to set another user types, you must use the UI.

```
# /opt/nessus/sbin/nessuscli adduser
Login: nessususer
Login password:
Login password (again):
Do you want this user to be a Nessus 'system administrator' user (can upload
plugins, etc.)? (y/n) [n]: y
```

When you are adding a new user, Nessus will prompt you for “User Rules”. Nessus has a rules system that allows you to restrict the hosts and ports that can be scanned as well as the plugins that can be used in scans. Administrators can set the rules on a per-user basis.

After you set the username, password, and administrator/system administrator privileges, you will be prompted for setting any Nessus rules:

User rules

nessusd has a rules system which allows you to restrict the hosts that nessususer has the right to test. For instance, you may want him to be able to scan his own host only.

Please see the Nessus Command Line Reference for the rules syntax

Enter the rules for this user, and enter a BLANK LINE once you are done : (the user can have an empty rules set)

Login : nessususer

Password : *****

This user will have 'system administrator' privileges within the Nessus server

```
Is that ok? (y/n) [n]: y
User added
```

To set the default, use the word “default”.

To accept to test anything by default:

```
default accept
```

Note: A blank rule set also allows the user to test anything.

After you put in the desired rules, you will be prompted to confirm your new user setup:

```
Login      : nessususer
Password   : *****
This user will have 'system administrator' privileges within the Nessus server
Is that ok? (y/n) [n]: y
User added
```

Network and Port Rules

To configure Nessus network scanning rules, the syntax is the following:

```
accept|reject address/netmask:ports
```

The address/netmask is in CIDR notation. For example, this will not let a user scan any IP address in the /24 (standard class C) network:

```
reject 10.42.123.0/24
```

For example, this will let a user scan any IP address in the /8 (standard class A) network:

```
accept 10.1.1.0/8
```

Additionally, you can define ports or a port range to be allowed or denied certain ports. For example, to forbid connecting to port 80 for 10.0.0.1:

```
reject 10.0.0.1:80
```

For example, to allow connecting to ports 8000 - 10000 for any host in the 192.168.0.0/24 subnet:

```
accept 192.168.0.0/24:8000-10000
```

Plugin Rules

In addition to setting network scanning limitations, you can also allow or deny the use of certain plugin IDs.

To deny a plugin from being run, use the following syntax:

```
plugin-reject 10335
```

To allow a plugin to run, use the following syntax:

```
plugin-accept 10000-40000
```

Remove a User

To remove a Nessus user, run the following command:

```
# /opt/nessus/sbin/nessuscli rmuser  
Login to remove: auditor  
User removed
```

Update Commands

The `nessuscli` commands offer the ability to update Nessus and Nessus plugins. By default, this tool will recognize the software update options selected through the Nessus UI.

Run the Default Update

To run the default update using the Nessus UI software options, use the following command. Below the default update options are configured to update both the UI and the plugins:

```
# /opt/nessus/sbin/nessuscli update

----- Fetching the newest updates from nessus.org -----

Nessus Plugins: Complete

Nessus Core Components: Complete

* Nessus Plugins are now up-to-date and the changes will be automatically processed
  by Nessus.
* Nessus Core Components are now up-to-date and the changes will be automatically
  processed by Nessus.
```

Force the Plugin and Core Components Update

If updating the Nessus core components is not configured to be upgraded, that option can be overridden with the `--all` option.

```
# /opt/nessus/sbin/nessuscli update --all

----- Fetching the newest updates from nessus.org -----

Nessus Plugins: Complete

Nessus Core Components: Complete

* Nessus Plugins are now up-to-date and the changes will be automatically processed
  by Nessus.
* Nessus Core Components are now up-to-date and the changes will be automatically
  processed by Nessus.
```

Update the Plugins Only

To force the `nessuscli` to update the plugins only, use the `--plugins-only` option:

```
# /opt/nessus/sbin/nessuscli update --plugins-only

----- Fetching the newest updates from nessus.org -----

Nessus Plugins: Complete

* Nessus Plugins are now up-to-date and the changes will be automatically processed
by Nessus.
```

Update a Specific Plugin Archive

If you wish to supply a plugin archive (e.g., for offline updates or supplying custom plugins), add the archive name after the update command:

```
# /opt/nessus/sbin/nessuscli update all-2.0.tar.gz

* Update successful. The changes will be automatically processed by Nessus.
```

Fetch Commands

The `nessuscli` commands offer the ability to manage Nessus registration from the command line. For online registration the commands include registering the scanner, confirming that Nessus has a valid registration code, and registering with SecurityCenter. For offline registration, the commands include registering the scanner and providing the challenge code. The `nessuscli` commands can also check that Nessus is properly configured with a valid registration code and can display the current activation code in use.

Register a Scanner Online

To register a Nessus scanner, run the following command:

```
# /opt/nessus/sbin/nessuscli fetch --register <serial>
```

Example:

```
# /opt/nessus/sbin/nessuscli fetch --register xxxx-xxxx-xxxx-xxxx
```

If the registration code is already in use, the following will be displayed:

```
# /opt/nessus/sbin/nessuscli fetch --register xxxx-xxxx-xxxx-xxxx
Nessus Plugins Error: The provided Activation Code (XXXX-XXXX-XXXX-XXXX) has already
been used
```

Register a Scanner with SecurityCenter

To register a Nessus scanner with SecurityCenter, run the following command:

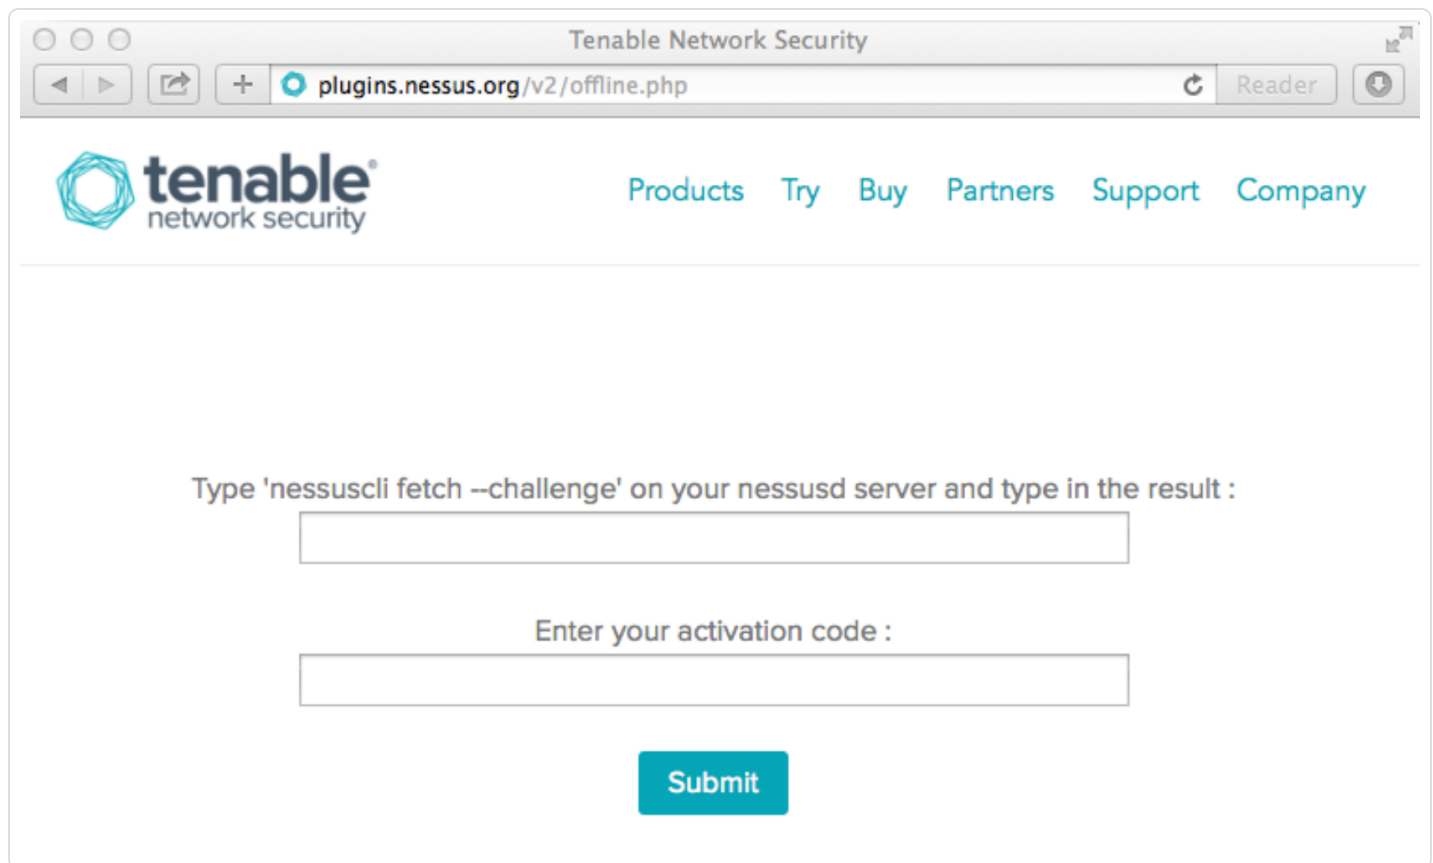

```
# /opt/nessus/sbin/nessuscli fetch --security-center  
nessusd can now be started, SecurityCenter will upload the plugins
```

Register a Scanner Offline

To register a Nessus scanner offline, obtain the challenge code for the scanner:

```
# /opt/nessus/sbin/nessuscli fetch --challenge
Challenge code: 4f6123cd8800ba128117be189eac3fe04fede52d7
You can copy the challenge code above and paste it alongside your
Activation Code at:
https://plugins.nessus.org/v2/offline.php
```

Once you have obtained your challenge code, go to the [offline activation website](https://plugins.nessus.org/v2/offline.php) to enter your activation code and the challenge code:

The screenshot shows a web browser window titled "Tenable Network Security" with the address bar displaying `plugins.nessus.org/v2/offline.php`. The page features the Tenable logo and navigation links: Products, Try, Buy, Partners, Support, and Company. The main content area contains the following text and form elements:

Type 'nessuscli fetch --challenge' on your nessusd server and type in the result :

Enter your activation code :

Submit

Once registered, you will receive the URL to copy and paste the license into your browser, and download the plugins and a link to download the `nessus.license` file. You can also scroll to the bottom of the screen to download the license instead of cutting and pasting it.

Tenable Network Security

plugins.nessus.org/v2/offline.php

Reader

ProductsTryBuyPartnersSupportCompany

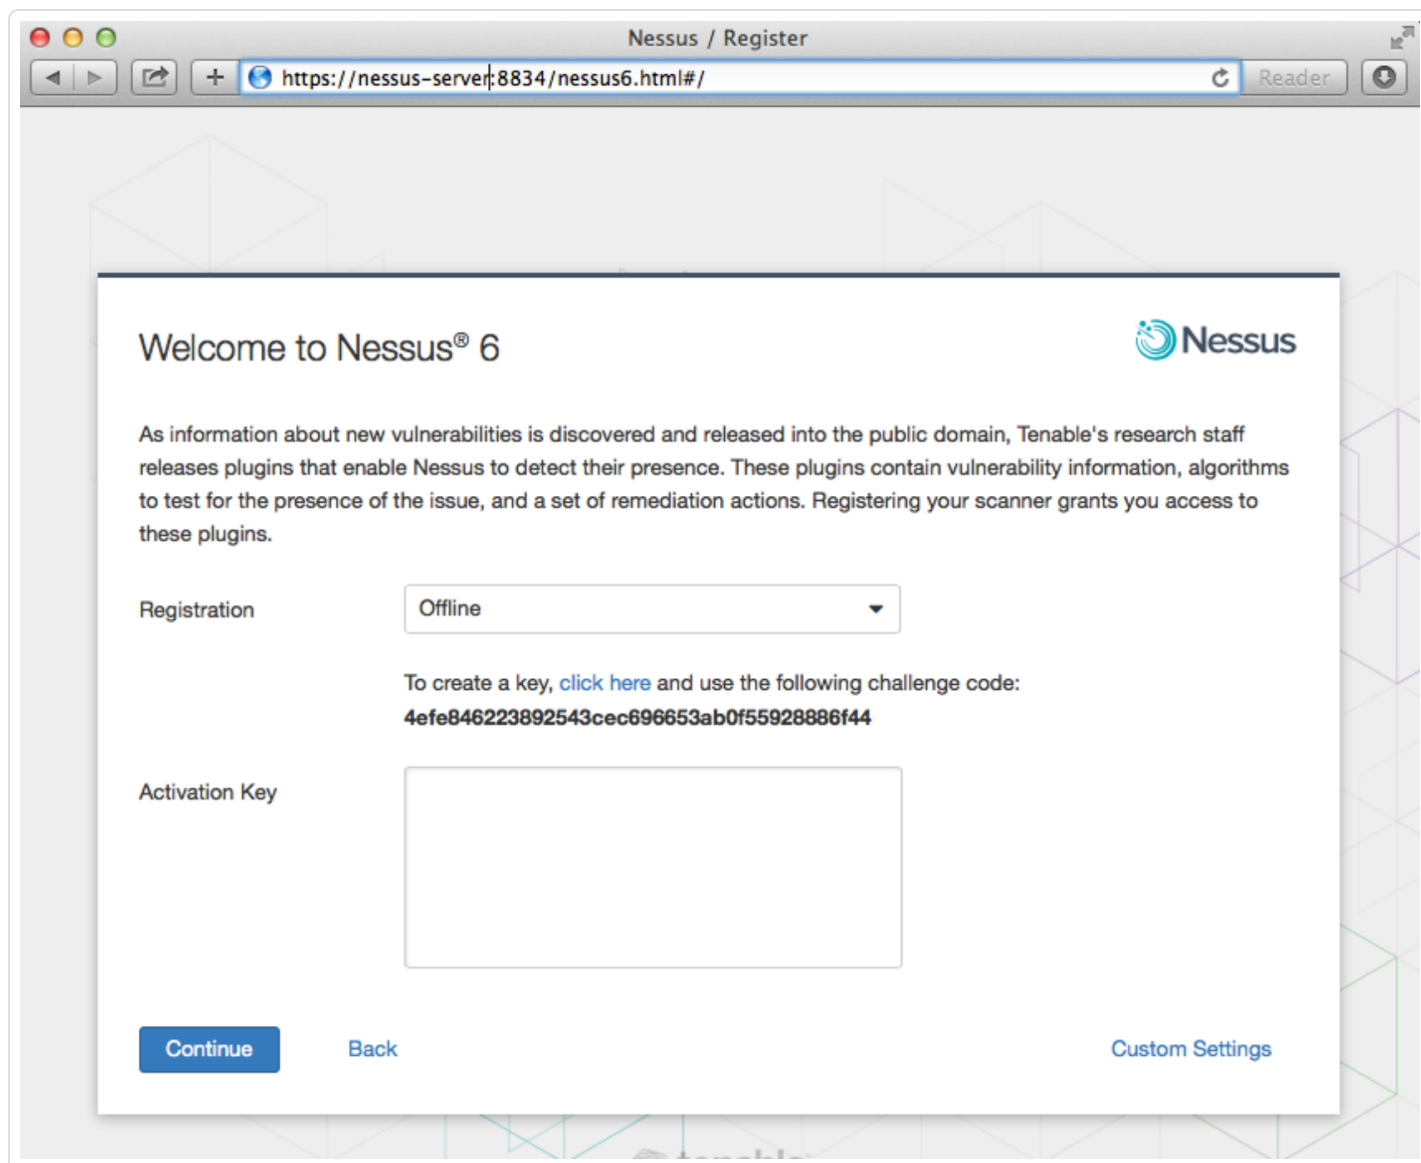

Thank you. You can now obtain the newest Nessus plugins at :

<http://plugins.nessus.org/v2/nessus.php?f=all-2.0.tar.gz&u=97d0e48e33ee5822f650f6d25fdb219&p=6a608028b5>

You can copy the following license and paste it into the Nessus console to proceed:

```
-----BEGIN TENABLE LICENSE-----
YStHdXYwVTJIemxpVlNKb
-----END TENABLE LICENSE-----
```

After you register your scanner as an offline scanner, paste the license key here:

Optionally, to register a Nessus scanner offline, run the following command:

```
# /opt/nessus/sbin/nessuscli fetch --register-offline <license.file>
```

Example:

```
# /opt/nessus/sbin/nessuscli fetch --register-offline nessus.license  
Nessus has been registered properly - thank you.
```

Confirm Nessus Registration Codes

To confirm that the Nessus scanner is registered properly, run the following command:

```
# /opt/nessus/sbin/nessuscli fetch --check
Checking...
Updates are configured properly
```

To display that the Nessus scanner activation code, run the following command:

```
# /opt/nessus/sbin/nessuscli fetch --code-in-use
Checking...
This scanner is using the following Activation Code: xxxx-xxxx-xxxx-xxxx
```

Bug Reporting Commands

The `nessuscli` commands also offer the ability to create an archive that can be sent to Tenable to help diagnose issues. By default, the script will run in interactive mode.

To create the bug report without any user interaction, use the `--quiet` option. The script will gather less information than if you ran in “full” mode.

The bug report generator can be run one of two ways: one with no command line options, and one to run in `--quiet` mode.

In quiet mode, there are two additional switches you can use. The `--full` switch will gather additional information for Tenable to use for debugging. The `--scrub` switch will clean any IPv4 addresses.

To create the bug report archive, run the following command:

```
# /opt/nessus/sbin/nessuscli bug-report-generator
```

This script will gather some information about your local system in order to help us diagnose the problems you are encountering.

This program does not send any data over the network, but simply creates an archive which contains useful information for the Nessus team to diagnose any problem you may be encountering.

This script can run in two modes:

If you run in “full” mode, this script will gather information you may deem to be sensitive (such as IP addresses, the list of running processes and your system log files). This information allows Tenable to better qualify your problem

If you do not run in “full” mode, this script will gather less information. Note that even in normal mode, depending on how you perform scanning some “sensitive” information may be contained in the resulting archive. Feel free to inspect it before sending it to Tenable.

```
Run in "full" mode? (y/n) [n]: n
```

```
Would you like to scrub the first two digits of any IPv4 address seen in the log files?
```

```
This may take several minutes.
```

```
Sanitize IPv4 subnets? (y/n) [n]: y
Bug report file name? [/opt/nessus/var/nessus/logs/nessus-bug-report-
archive.tar.gz]: ~/nessus-bug-report-archive.tar.gz

-> Collecting script environment information...
```

Thank you! Now please send the file /root/nessus-bug-report-archive.tar.gz to:
- bug-reports@nessus.org (if you are not a direct feed customer)

or

- Tenable Support (if you are a direct feed customer)

Note: Using `--full` or `--scrub` is dependent on using `--quiet` first. If the `--quiet` option is not used, the bug report generator ignores anything else and runs in full mode.

Note: Even in “normal” mode, the script may pick up sensitive information depending on how your scans are configured.

```
# /opt/nessus/sbin/nessuscli bug-report-generator --quiet

Nessus Agents

The Nessus Agent has a specific version of `nessuscli`. This version contains the fix commands and bug report generator described earlier in the document. Additionally, there are a set of commands for controlling and configuring the Nessus Agent locally.

Link Windows Agents During Installation

Windows path for Nessus Agents:

C:\Program Files\Tenable\Nessus Agent\

-or-

C:\ProgramData\Tenable\Nessus Agent\

Nessus Agents can be deployed and linked on Windows through the `msiexec` command. See example below:

```
# msiexec /i NessusAgent-6.8-x64.msi NESSUS_GROUPS="Remote Agent Group 1" NESSUS_SERVER="172.26.23.34:8834" NESSUS_KEY=00a0927cb3df64d466ccd7ccbcc2d63fea1ea91f5ea5ebe22390a4d69caa6c6acf /qn
```

Note: To use the Nessus Agent command line tools on Windows, you must run `cmd.exe` as administrator.

Help Commands

To display the command line usage for `nessuscli`, type the following:

```
# /opt/nessus_agent/sbin/nessuscli help
```

The output will display as follows:

```
Usage: nessuscli command [options]
```

```
Usage: nessuscli command help
```

Fix Commands:

- fix [--secure] --list
- fix [--secure] --set <name=value>
- fix [--secure] --get <name>
- fix [--secure] --delete <name>
- fix --list-interfaces
- fix --reset

Local Agent Commands:

- agent link --key=<key> [--name=<name>] [--groups=<group1,group2,...>] [--ca-path=<ca_file_name>] [host] [proxy]
- agent unlink
- agent status

Bug Reporting Commands:

- bug-report-generator
- bug-report-generator --quiet [--full] [--scrub]

Local Agents Commands

The Nessus Agent commands can link or unlink agents, or it can report on the status of the agent.

Link and Unlink the Nessus Agent

To link an agent, you will use the key value from the Nessus Manager. Other options include the name of the Nessus Agent, the Agent group or groups that the agent will be part of, the CA path, the host, and the port for the Agent to connect.

Basic usage for the Nessus Agents command line:

```
# /opt/nessus_agent/sbin/nessuscli agent link --  
key=00b5a8fec9f3a21fa1cff66ce99c6324adf324226948c6f1516eb9f9433b964744
```

Once the agent is successfully linked, you will see the output following the command:

```
# /opt/nessus_agent/sbin/nessuscli agent link --  
key=00b5a8fec9f3a21fa1cff66ce99c6324adf324226948c6f1516eb9f9433b964744 --groups=  
Workstation --host=ndev3 --port=8834  
Agent successfully linked
```

If there were issues connecting the Agent to the Manager, you will see a **Failed to link the agent** message.

```
# /opt/nessus_agent/sbin/nessuscli agent link --  
key=00abd4c487c472edb77cea8a14bb8c603a88203a2e6bf1f6df46159b5ad5ef18df --  
name=Workstation --groups=Accounting --host=172.16.44.252 --port=8834  
Failed to link the agent:
```

Check the Nessus Agent Status

The Nessus agent status will show you if an agent is linked, and how many jobs are pending if it is linked.

```
# /opt/nessus_agent/sbin/nessuscli agent status  
Agent linked  
0 jobs pending
```

If the Nessus agent is not linked, the status will show that it is not linked to any servers.

```
# /opt/nessus_agent/sbin/nessuscli agent status  
Agent not linked to a server
```

If the Nessus Agent is linked, the status will show the IP address of the connected server and port:

```
# /opt/nessus_agent/sbin/nessuscli agent status  
Agent is linked to 172.26.16.184:8834  
0 jobs pending
```

Bug Report Generator Commands

The Nessus Agent bug report generator command works the same way as the other Nessus products.

To create the bug report archive, run the following command:

```
# /opt/nessus_agent/sbin/nessuscli bug-report-generator
```
